Statistics: Mean 9.385; Variance 5.205; scale 1.803

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 PT DNA encoding osteoclastogenesis inhibitory factor protein - useful
 PT for bone resorption control, esp. treatment of osteoporosis
 PS Claim 36: Page 135-136; 183pp; Japanese.
 CC This sequence encodes a mutated version of the full length
 CC osteoclastogenesis inhibitory factor (OCIF) of the invention. This
 CC sequence encodes OCIF-C225 in which the 22nd Cys residue in the mature
 CC OCIF protein is substituted by Ser. The OCIF of the invention has a
 CC molecular weight by SDS-PAGE of 60 kD under reducing conditions and
 CC 120 kD under non-reducing conditions. The protein is adsorbed onto
 CC cation-exchangers or heparin and its activity is lowered after 10 mins
 CC at 70 deg C or 30 mins at 56 deg C, and is lost after 10 mins at 90
 CC deg C. OCIF is useful in the control of bone resorption and therefore
 CC in the treatment and prevention of disorders of bone resorption, e.g.
 CC osteoporosis.

PT DNA encoding osteoclastogenesis inhibitory factor protein - useful
PT for bone resorption control, esp. treatment of osteoporosis
PS Claim 33, Page 134-135; 183pp; Japanese.
CC This sequence encodes a mutated version of the full length
CC osteoclastogenesis inhibitory factor (OCIF) of the invention. This
CC sequence encodes OCIF-C21S in which the 21st Cys residue in the mature
CC OCIF protein is substituted by Ser. The OCIF of the invention has a
CC molecular weight by SDS-PAGE of 60 kD under reducing conditions and
CC 120 kD under non-reducing conditions. The protein is adsorbed onto
CC cation-exchangers or heparin and its activity is lowered after 10 mins
CC at 70 deg.C or 30 mins at 56 deg.C, and is lost after 10 mins at 90
CC deg.C. OCIF is useful in the control of bone resorption and therefore
CC in the treatment and prevention of disorders of bone resorption, e.g.
CC osteoporosis.

PT DNA encoding osteoclastogenesis inhibitory factor protein - useful
   for bone resorption control, esp. treatment of osteoporosis
PS Claim 42: Page 137-138, 183pp; Japanese.
CC This sequence encodes a mutated version of the full length
   osteoclastogenesis inhibitory factor (OCIF) of the invention. This
   sequence encodes OCIF-DCR1 in which amino acids 2-42 of the mature
   protein have been deleted. The OCIF of the invention has a molecular
   weight by SDS-PAGE of 60 kd under reducing conditions and 120 kd under
   non-reducing conditions. The protein is adsorbed onto cation-exchangers
   or heparin and its activity is lowered after 10 mins at 70 deg.C or 30
   mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful
   in the control of bone resorption and therefore in the treatment and
   prevention of disorders of bone resorption, e.g. osteoporosis.

 PT DNA encoding osteoclastogenesis inhibitory factor protein - useful
 PT for bone resorption control, esp. treatment of osteoporosis
 PS Claim 81; Page 149; 183pp; Japanese.
 CC This sequence encodes a mutated version of the full length
 CC osteoclastogenesis inhibitory factor (OCIF) of the invention. This
 CC sequence encodes OCIF-CspH in which amino acids 298-380 of the mature
 CC protein have been deleted and replaced by Ser-Ileu-Asp. These amino

CC acid changes have been caused by the introduction of a restriction
 CC site. The OCIF of the invention has a molecular weight by SDS-PAGE of
 CC 60 kD under reducing conditions and 120 kD under non-reducing
 CC conditions. The protein is adsorbed onto cation-exchangers or heparin
 CC and its activity is lowered after 10 mins at 70 deg.C or 30 mins at 56
 CC deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful in the
 CC control of bone resorption and therefore in the treatment and
 CC prevention of disorders of bone resorption, e.g. osteoporosis.

PT DNA encoding osteoclastogenesis inhibitory factor protein - useful
 PT for bone resorption control, esp. treatment of osteoporosis
 PS Claim 45; Page 138-139; 183pp; Japanese.
 CC This sequence encodes a mutated version of the full length
 CC osteoclastogenesis inhibitory factor (OCIF) of the invention. This
 CC sequence encodes OCIF-DCR2 in which amino acids 43-84 of the mature
 CC protein have been deleted. The OCIF of the invention has a molecular
 CC weight by SDS-PAGE of 60 kd under reducing conditions and 120 kd under
 CC non-reducing conditions. The protein is adsorbed onto cation-exchangers
 CC or heparin and its activity is lowered after 10 mins at 70 deg.C or 30
 CC mins at 56 deg.C, and is lost after 10 mins at 90 deg.C. OCIF is useful
 CC in the control of bone resorption and therefore in the treatment and
 CC prevention of disorders of bone resorption, e.g. osteoporosis.
